Assignment 6

October 15, 2018

0.1 Assignment 6: Implement SGD for linear regression

To implement stochastic gradient descent to optimize a linear regression algorithm on Boston House Prices dataset which is already exists in sklearn as a sklearn.linear_model.SGDRegressor.here,SGD algorithm is defined manually and then comapring the both results.Linear regression is technique to predict on real values. ##### stochastic gradient descent technique , evaluates and updates the coefficients every iteration to minimize the error of a model on training data.

0.2 Objective:

To Implement stochastic gradient descent on Bostan House Prices dataset for linear Regression

- Implement SGD and deploy on Bostan House Prices dataset.
- Comapare the Results with sklearn.linear_model.SGDRegressor

```
In [54]: from sklearn.datasets import load_boston # to load  datasets from sklearn
         import matplotlib.pyplot as plt
         from sklearn.cross_validation import cross_val_score

         import sklearn.cross_validation
         from sklearn.cross_validation import KFold
         import numpy as np
         import seaborn as sns

         from collections import Counter
         from sklearn.metrics import accuracy_score
         from sklearn import cross_validation
         from sklearn.preprocessing import StandardScaler
         import pandas as pd
         import math

         import pytablewriter
```

```
In [2]: boston = load_boston()
        # Shape of Boston datasets
        print(boston.data.shape)
```

```

```

```
In [3]: #  to understand datasets
        print(boston.DESCR)
```

```
Boston House Prices dataset
===========================

Notes
------
Data Set Characteristics:

    :Number of Instances: 506

    :Number of Attributes: 13 numeric/categorical predictive

    :Median Value (attribute 14) is usually the target

    :Attribute Information (in order):
        - CRIM     per capita crime rate by town
        - ZN       proportion of residential land zoned for lots over 25,000 sq.ft.
        - INDUS    proportion of non-retail business acres per town
        - CHAS     Charles River dummy variable (= 1 if tract bounds river; 0 other
        - NOX      nitric oxides concentration (parts per 10 million)
        - RM       average number of rooms per dwelling
        - AGE      proportion of owner-occupied units built prior to 1940
        - DIS      weighted distances to five Boston employment centres
        - RAD      index of accessibility to radial highways
        - TAX      full-value property-tax rate per $10,000
        - PTRATIO  pupil-teacher ratio by town
        - B        1000(Bk - 0.63)^2 where Bk is the proportion of blacks by town
        - LSTAT    % lower status of the population
        - MEDV     Median value of owner-occupied homes in $1000's

    :Missing Attribute Values: None

    :Creator: Harrison, D. and Rubinfeld, D.L.

This is a copy of UCI ML housing dataset.
http://archive.ics.uci.edu/ml/datasets/Housing

This dataset was taken from the StatLib library which is maintained at Carnegie Mel

The Boston house-price data of Harrison, D. and Rubinfeld, D.L. 'Hedonic
prices and the demand for clean air', J. Environ. Economics & Management,
vol.5, 81-102, 1978.   Used in Belsley, Kuh & Welsch, 'Regression diagnostics
```

```
...', Wiley, 1980.   N.B. Various transformations are used in the table on
pages 244-261 of the latter.

The Boston house-price data has been used in many machine learning papers that addr
problems.

- sgdreg_function is function for stochastic gradient descen for linear regression using linear_model.SGDRegressor in sklearn.
- In this function different batch size (50,100,150,200) is applied on linear_model.SGDRegressor to get best learning rate,epoch value,error rate.
- here,delta_Error and prediction of price with batch size graph is shown.
- RMSE vs epoch graph is shown
- Also,RMSE vs learning rate graph is shown for different batch value.

         3      100.0           6.462349e-27
```

Observation:

- In sklearn SGDRegressor,It is observed that as batch size increases optimal learning rate decreses.
- RMSE value is around 5 and MSE value is around 30
- RMSE value for batch size 100 is high comparatively with others batch size.
- For Batch size=200, RMSE & learning Rate is lowest.

```

3.2 Observation

- In stochastic gradient descent Manual model(a user designed model),RMSE(root mean squared error) is varied as compared to sklearn designed stochastic gradient descent model for varied number of batch_size.
- Graphs between learning rate vs RMSE & Epoch Vs RMSE are plotted.
- From the graph , stochastic gradient descent model performance can be observed .

Comparision of SGD_sklearn and SGD_manual with batch_size=150 :-

```
* Distributions Plots for  errors(y - y_hat) and It is overlapping as shown in grap

* "Delta_error using manual SGD Vs Delta_error using Sklearn SGD" graph is plotted

* RMSE Vs epoch for manual SGD graph looks like almost "L" shape.So, Model doesn't

* RMSE value and MSE value for batch_size 150 is almost similar as seen in above ta

*  Optimal learning rate is low for SGD sklearn and 1 which high in this case is fo
```
